

## AND ProductInformation EditClients: LibEdit

### *Laying the basis for network modelling*

Network components in AND are represented by graphic symbols and organized into libraries that can be quickly drawn and comfortably maintained with the easy-to-use component editor AND LibEdit.

Each component is defined with multi-layer details pertaining to its characteristics according to vendor specifications: physical, RF, electrical, optical and so forth.

Furthermore, sourcing and pricing data, installation effort etc. can be added to each component.

Authorized users can define company rules for components in the libraries, e.g. target levels for amplifiers. The libraries can then be transferred to the server and automatically made available to all planners. The database administration tool DbAdmin manages the privileges and access rights.

AND LibEdit is automatically included with each user application license, e.g. AND FibreCo.
