

AND ProductInformation EditClients: LocalArea

Local area networks in AND

Combining a fast learning curve with simple installation AND LocalArea is an out-of-the box solution allowing you to immediately begin your schematic design and documentation of DTH installations, hotels, and in-house networks.

Detailed information about all the components in the local area network is available including settings, expected status and performance.

The entire process is fully interactive as documentation, design and engineering tasks are carried out simultaneously – there is no need for separate tools and modules. As well as ensuring data integrity this also contributes considerably to greater efficiency throughout your workforce.

The network modelling facilities enable the user to calculate RF levels for forward and return path as well as distortion products and noise, calculate remote powering, define test points, trace signals, automatically generate in-house networks and create bills of material. Network checks ensure designs remain within pre-defined specifications.
